

What is considered a potential exposure to rabies?

Bites that break the skin
from an animal capable of
transmitting the rabies virus
are a potential rabies
exposure. Bites from cats
and dogs are the most
commonly reported
exposures from pets in MT.

NON-BITE EXPOSURES

This type of exposure rarely causes rabies. The causes rabies. The or abrasions (including membranes with saliva or other like brain matter, from a non-bite exposure.

BAT EXPOSURES

Most bats are not rabid.
However, any direct contact
between a human and a bat
should be evaluated for an
exposure. Other situations that
might qualify as exposures
include finding a bat in the same
room as a person who might
be unaware that a bite or direct
contact had occurred, such as
those who are sleeping.

Do you think you were potentially exposed?

Contact your healthcare provider or local health department.

The following is <u>not</u> considered a potential exposure to rabies:

- Touching a surface or object a potentially rabid animal has touched
- Touching a healthy pet that may have handled a bat or other rabid animal recently
- If a bat or skunk is found outside where humans or animals could not have had contact
